

petition for a two month extension of time under 37 CFR § 1.136(a) filed herewith, please reconsider the rejection in view of the following amendment and remarks.

Please amend the application as follows:

**IN THE SPECIFICATION**

Please replace the specification in accordance with 37 C.F.R. 1.121(b)(3). A clean substitute specification and a marked-up specification are provided herewith in compliance with 37 C.F.R. 1.125(b) and (c).

**IN THE CLAIMS**

Please amend the claims as follows:

1. (Canceled) An attachable bearing bracket inserted into any open or closed enclosure, allowing a sound replicator and or speaker to gyrate freely around its circumference/inner perimeter that consist of:

An outer circular ring having a channelized spherical notch;

Ball bearings that reside in the said notch;

An inner circular ring having a notch that resided inscribed in the circle to said outer ring;

Ball bearing placed between said outer and inner rings;

Spherical balls provide a friction free environment for gyrating said inner ring;

The combination of said inner and outer circular rings comprise into functional bracket;

2. (Canceled) Apparatus as described in claim one above further comprising:

Said acoustical replicator defines a top face or front of said bracket;

Said front or top face brackets adjoins said inner circular ring;

An acoustical replicator fastens in said inner circular gyrating ring;

3. (Canceled) The mechanism as described in claim two above encompasses the adding of mounts on a pre-existing or proposed design application.

4. (Canceled) The device as described in claim one above wherein said outer circular ring and said ball bearings and said inner circular ring and with but not obligatory said acoustical replicator, have a gyrating disposition on any gyrating degrees.

5. (Canceled) The mechanism as described in claim one above provided unregulated variable rotations on its axis from its environment.

6. (Canceled) The combinational effort reproduced, allows sound waves to gyrate sporadically outwards towards its destine.

7. (Canceled) The combinational effort reproduced, allows sound waves to gyrate sporadically outwards towards its kinetic energy.

8. (Canceled) The bracketed said sound replicator can thus be gyrated more rapidly through kinetic energy absorbed through enclosure.
9. (Canceled) Said unregulated variable rotations disposes said waves to enhance sound effects.
10. (New) A bracket for supporting an acoustical speaker relative to an enclosure, the bracket comprising:
  - a ring comprising an outer portion, an inner portion, and a channel therebetween;
  - a plurality of bearings disposed within the channel, wherein the inner portion is rotatable relative to the outer portion and wherein the inner portion is adapted to receive the acoustical speaker;
  - a first securing portion disposed on the inner portion, the first securing portion being adapted to secure the acoustical speaker to the inner portion; and
  - a second securing portion, the second securing portion being adapted to secure the ring to the enclosure.
11. (New) The bracket of claim 10, wherein the ring is adapted to receive a second acoustical speaker, and the first securing portion is adapted to secure the plurality of acoustical speakers to the inner portion.
12. (New) The bracket of claim 10, wherein the bearings comprise one of a cylindrical bearing, angular bearing, linear bearing, needle roller bearing, thrust bearing, pressed bearing, Y-bearing, angular ball bearing, toroidal roller bearing, spherical roller bearing, and taper roller bearing.
13. (New) The bracket of claim 10, wherein the inner portion has a diameter equal to the outer portion, and is configured to be disposed between the outer portion and the enclosure.
14. (New) The bracket of claim 10, wherein the inner portion has an outer diameter smaller than the inner diameter of the outer portion, the inner portion being disposed concentrically within the outer portion.
15. (New) The bracket of claim 12, wherein the bearings are formed from plastic.
